

DH2642 Project AI Usage

Daniel Ruijs

Mattias Kvist

May 18, 2026

This document describes how AI tools were used in the development of this project.

Code generation

AI tools were used to generate code to speed up development. The generated code was always reviewed by us to ensure we understood it and that it followed the course code conventions. In most cases this meant refactoring the generated code to fit our style and to ensure it was maintainable. Examples of prompts used for code generation include:

“rework the route delay leaderboard to use material ui table”

“add a button to navigate from departure view details to the corresponding route delay details page (the page with trend chart) for the same route (route name+type)”

“resolve merge conflicts in the PR into main and add missing translations” -> commit

<https://github.com/mattiaskvist/forseningskartan/pull/132/commits/73e41f80998823817c6291f0fcff7f6704b01be8>

“add any missing translations that are missed in the new code this PR introduces” ->

<https://github.com/mattiaskvist/forseningskartan/commit/2ef140cae865da62ca1e8c903d431349c1d64e7a>

“Attend the review comments on the PR into main from this branch” ->

<https://github.com/mattiaskvist/forseningskartan/commit/be88842d25f811baa72a673edb8bef8ca505c0df>

“i opened a PR into main and there are conflicts, please resolve them” ->

<https://github.com/mattiaskvist/forseningskartan/pull/138/commits/46862f1841b89284c175f416049debc16d738bd3>

“Review the frontend codebase with regards to simplicity, readability and comments, anti-patterns and strict model-view-presenter architecture.” -> suggestions on MVP improvements

“copilot has reviewed the pr. Read the comments, see if they make sense, and suggest improvements if needed”

“Attend the review comments on the PR into main from this branch” On branch f/custom-date-range

“lets add some brief comments to the functions we changed and then give me copy-pastable commit commands”

“now resolve the merge conflicts in the PR”

Code review

For code review, we used GitHub’s Copilot code review tool to assist in reviewing pull requests. This tool provides suggestions and highlights potential issues in the code, which helped us minimize mistakes. However, this was only used as a first pass in the review process, and we still manually reviewed all code to ensure it met our standards and that we understood it.
